

Money flow application

Thank you for your interest in Nordea. As there was no portfolio provided, we would like to qualify you with a small task. Please complete the following task and provide the solution as a Git link to mikhail.belov@nordea.com.

1. Write an application that fetches data about one's imaginary monthly bank statements from an external API. Parse data to calculate monthly balance with income and spending that is sent to an external API. There is no need to build a persistence layer.

2. Things to consider

- * What problem does this application try to solve?
- * What kind of architecture was used to achieve the solution?
- * How to test your application?
- * If the application must be deployed to a server in a remote location, how would you do it?
- * There is no real API to connect to. Think about how you can start implementing your solution before other parties are ready with their implementations.
- * Do not mention Nordea in the code
